

# Taxonomy

©MARIAN E. RICE

Shoams

# Name the animal:

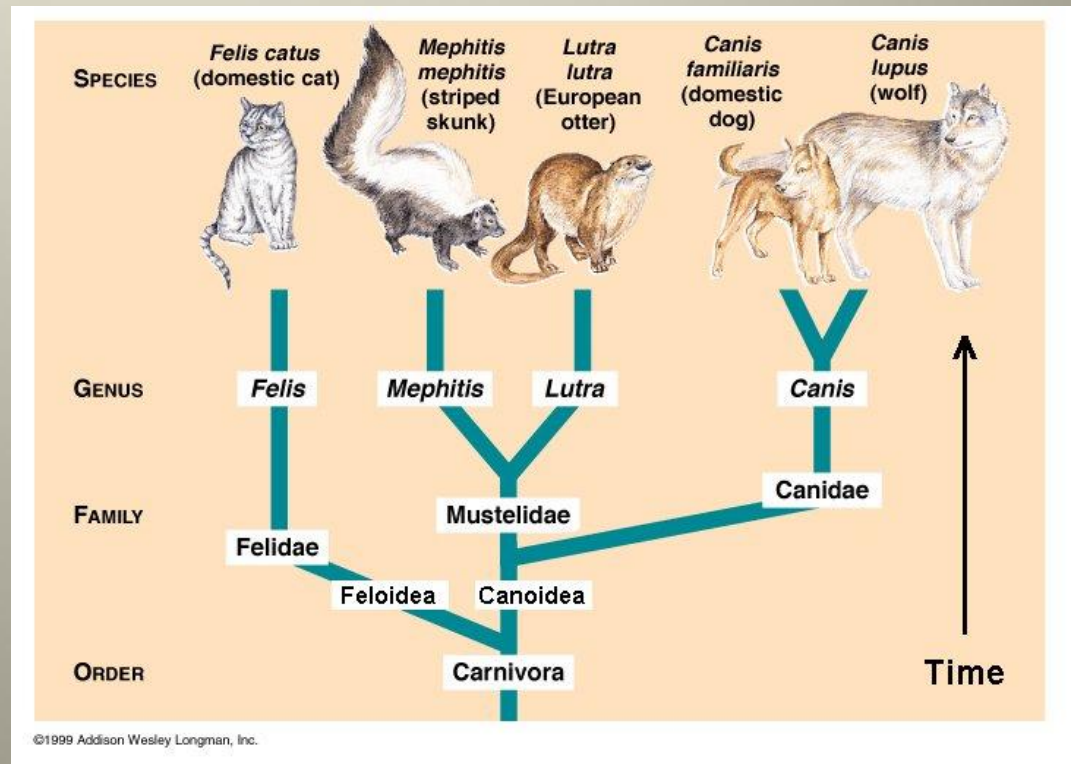

# Diversity in within species

# What is taxonomy?

The science of naming organisms and assigning them into groups called taxa (singular: taxon)

# What is the biosphere?

- The part of the earth inhabited by living organisms

# How does the biosphere relate to taxonomy?

Taxonomy attempts to classify all organisms within the biosphere

# How does the biosphere relate to taxonomy?

Taxonomy attempts to classify all organisms within the biosphere based on observed characteristics such as morphology, behaviour and sometimes even geographic location.

# Approximately how many types of living organisms are there on earth?

- 30 to 100 million
- Only 1.75 million have been described so far

# How did the invention of the microscope affect taxonomy?

- More organisms were discovered, therefore, more organisms to classify

# Aristotle

I categorized according to habitat:

- water dwellers
- land dwellers
- air dwellers

# St. Augustine

I categorized based on  
a human centered view

- Useful, harmful, superfluous (not necessary)
  - Didn't consider certain animals necessary in the environment

# John Ray

- John Ray was born on November 29, 1627, in the village of Black Notley, Essex, England
- His father was a blacksmith and his mother was a healer and herbalist
- John Ray liked nature and especially plants.
- Coined the term **Species** – organisms **similar in shape and structure and could reproduce with each other**

# Carl Linnaeus

## 1707-1778

- Considered the father of taxonomy
- Grouped organisms according to their structural similarities and shared characteristics.
- invented the Binomial nomenclature to classify organisms. Used genus and species based on the Latin names of the organisms
- Latin was the language of scholars at the time.
- Canis familiaris* is the scientific name for a dog.  
(domestic dog)

# Traditional taxonomical Ranks of Classification

- Kingdom
- Phylum
- Class
- Order
- Family
- Genus
- Species

- Memory aid (mnemonic device)

–King Phillip called out for good  
soup

# Classification System

	Brown Bear	House cat	Dog	Killer whale	Wolf
<b>K</b> ingdom	Animalia	Animalia	Animalia	Animalia	Animalia
<b>P</b> hylum	chordata	chordata	chordata	chordata	chordata
<b>C</b> lass	mammalia	mammalia	mammalia	mammalia	mammalia
<b>O</b> rders	carnivora	carnivora	carnivora	cetacea	carnivora
<b>F</b> amily	ursidae	felidae	canidae	delphinidae	canidae
<b>G</b> enus	ursus	felis	canis	orcinus	canis
<b>S</b> pecies	arctos	catus	familiaris	orca	lupus

# Binomial Nomenclature

- A two word system of uniquely naming organisms according to their genus and species
- First letter of genus name is **capitalized**
- Both words **italicized**
  - i.e. *Homo sapien*

# Binomial Nomenclature

## BINOMIAL NOMENCLATURE OF SOME COMMON PLANTS AND ANIMALS

COMMON NAME	BINOMIAL NOMENCLATURE
<b>A. PLANTS</b>	
1. Pea plant	<i>Pisum sativum</i>
2. Onion plant	<i>Allium cepa</i>
3. Mango plant	<i>Mangifera indica</i>
4. Wheat plant	<i>Triticum aestivum</i>
5. Banyan tree	<i>Ficus bengalensis</i>
6. Soya bean	<i>Glycine max</i>
<b>B. ANIMALS</b>	
1. Frog	<i>Rana hexadactyla</i>
2. Cat	<i>Felis domestica</i>
3. Dog	<i>Canis familiaris</i>
4. Housefly	<i>Musca domestica</i>
5. Cobra	<i>Naja naja</i>
6. Common carp (Fish)	<i>Cyprinus carpio</i>

# Advantages of using the binomial nomenclature system

1. Universal scientific communication
2. Unique for every living thing
3. Show relationship between closely related organisms

# Dichotomous Key

Di - two

# Dichotomy

- Splitting of a whole into exactly two mutually exclusive parts
- (example: “good” versus “bad”)

WACKY PEOPLE

Wacky  
people  
dichotomy

<p><b>Step 1</b>          If fish shape is long and skinny then go to step 2          If fish shape is not long and skinny go to step 3</p>	<p><b>Step 5</b>          If fish has spots, go to step 6          If fish does not have spots, go to step 7</p>
<p><b>Step 2</b>          If fish has pointed fins, it is a trumpet fish          If fish has smooth fins, it is a spotted moray eel</p>	<p><b>Step 6</b>          If fish has chin whiskers, it is a spotted goat fish          If fish does not have chin whiskers, it is a band-tail puffer</p>
<p><b>Step 3</b>          If fish has both eyes on top of head, go to step 4          If fish has eye on each side of the head, go to step 5</p>	<p><b>Step 7</b>          If fish has stripes, go to step 8          If fish does not have stripes, it is a glassy sweeper</p>
<p><b>Step 4</b>          If fish has long whip like tail, it is a spotted eagle ray          If fish short blunt tail, it is a peacock flounder</p>	<p><b>Step 8</b>          If fish has a V-shaped tail, it is a squirrel fish          If fish has a blunt tail, it is a glass eye snapper</p>

# What is a dichotomous key used for?

- Used to help place organisms into an appropriate classification group

# What are the 2 conditions for a properly written dichotomous key?

- 2 choices for each characteristic
- Unique ending for each individual item  
(think of the fish example)

# Two ways a dichotomous key can be represented?

- Diagrammatically (tree/flow chart)
- With words

## How does a dichotomous key relate to the 7 taxa and binomial nomenclature?

- Characteristics that define the choices (dichotomy) are often based on the characteristics that subdivide each taxa (e.g. vertebrate vs. invertebrate)
- A true key ends with a scientific name of the organism using the binomial nomenclature system

Similar structures are referred to as homologous structures

# Classification System

Grizzly bear   Black bear   Giant panda   Red fox   Abert squirrel   Coral snake   Sea star

**KINGDOM Animalia**

**PHYLUM Chordata**

**CLASS Mammalia**

**ORDER Carnivora**

**FAMILY Ursidae**

**GENUS Ursus**

**SPECIES *Ursus arctos***
